

# Stop the Spread of Omicron Variant ! !

## Characteristics of the Omicron Variant

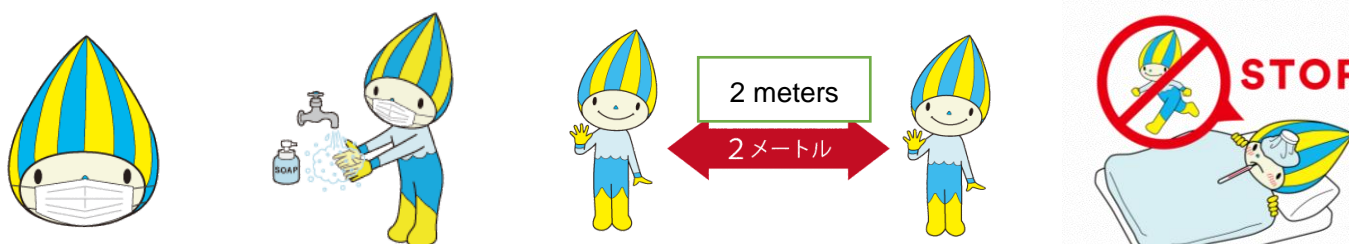

Highly Infectious

Quick onset of disease

Possibility of infection even after 2 vaccinations

The symptoms are more severe than an ordinary cold, making commuting to work, etc. impossible for several days.

However, infection can be prevented through basic prevention measures.

## Please consider a third vaccination.

The most important thing is getting the vaccine as soon as possible, not the type of vaccine! A third dose of either vaccine significantly increases resistance (antibody titer).

About the third dose		Pfizer	Moderna
Antibody titer (28 days after vaccination)		<b>54.1 times</b>	<b>67.9 times</b>
Rate of side effects occurrence	Fever over 38°C	21.4%	49.2%
	General malaise	69.1%	78.0%
	Headache	55.0%	69.6%

※Side effects are most likely to occur after 1 day of vaccination and will almost disappear after 3 days (according to the data published by the Ministry of Health, Labor and Welfare).

## Please be careful when attending spring events.

Avoid activities with a high risk of infection, such as parties associated with cherry blossom viewing, Easter, etc. in large groups or for long periods of time, and going to crowded places.
